

Smarter government for a smarter planet.

Today, local and national governments are infusing more intelligence into their systems to stimulate economies and address the needs of citizens through smarter operations.

Smarter government is more than simply regulating the outputs of economic and societal systems. It is a smoothly functioning system on its own, interconnecting and interfacing dynamically with citizens, communities and businesses in real time to spark growth, innovation and progress.

With India's population already at 1.3 billion and growing, the scalability and complexity required of this task could become enormous. Having worked with governments in more than 150 countries, IBM recognizes the challenges they face as they reach out to include citizens across digital and economic divides.

By its very nature, smarter government benefits every segment of the population. For example, SAHANA, an open source disaster management system deployed by national and state governments, has been a boon to citizens affected by natural disasters. Developed in the wake of the Bhuj earthquake of 2001 and the pan-Asian tsunami in 2004, it has helped millions of people in rebuilding their lives after the Bihar floods of 2008.

Smarter government has also inspired one of the largest transport networks in the world—Indian Railways. Today,

more than 100,000 employees use the Crew Management System (CMS) that automates and regulates the day-to-day management of staffing on board the trains. Coupled with direct data access over mobile phones, CMS helps manage crew deployment more effectively and improves visibility of information to the right person at the right time, resulting in new efficiencies for the railway system.

Smarter government also provides up-to-the-minute information, offering valuable and sometimes critical support to its citizens. Today, a Real Time Crime Centre system helps the New York City police analyze crime information to improve public safety. With a 27% drop in crime since 2001, it has made New York the safest large city in the U.S. Data analysis also helps fight problems of daily life, such as traffic gridlocks. This has paved the way for the smart traffic systems of Singapore, Brisbane and Stockholm to reduce both congestion and pollution.

Systems such as these, along with integrated service delivery, offices that support multiple services and technology-driven transactional abilities, are clear signs of smarter governance.
