

SUNDAY HO YA MONDAY...

ROZ KHAO ANDE.

Attention children...

Here are a few reasons why eggs are a perfect breakfast diet for you.

Eggs are one of the most nutritious food items. They are not just fat (yolk) and protein (white). In fact, they contain a wide array of essential vitamins and minerals. If your children have already started learning about vitamins, proteins and minerals in school, then they surely will understand the information provided below.

FULL OF VITAMINS

- A:** good for the skin and growth.
- D:** strengthens bones by raising calcium absorption.
- E:** protects cells from oxidation.
- B1:** helps properly release energy from carbohydrates.
- B2:** helps release

energy from protein and fat.

B6: promotes the metabolism of protein.

B12: an essential vitamin in the formation of nerve fibers and blood cells.

BUBBLING WITH MINERALS

Iron: essential in the creation of red blood cells.

Zinc: good for enzyme stability and essential in sexual maturation.

Calcium: most important mineral in the strengthening of bones and teeth.

Iodine: controls

thyroid hormones.

Selenium: like vitamin E, it protects cells from oxidation.

BEST TYPE OF PROTEIN

If that wasn't enough, egg whites contain the purest form of protein found in whole-foods. It is so high that nutritionists use them as the standard when comparing other whole-food proteins. Their "biological value" -- a measurement used to determine how efficiently a protein is used for growth -- is 93.7. Milk, fish, beef, and rice respectively have a

bio value of 84.5, 76, 74.3, and 64.

The higher the value, the better the protein is absorbed. This is why many bodybuilders include eggs in their diet. When a person eats beef, for instance, all of the protein is not necessarily absorbed and used to rebuild tissue.

Protein is a complex substance, which is why bodybuilding protein supplement makers are constantly trying to refine the quality of their product and why some protein shake brands boast that their protein is made from egg whites. Having said that, each large egg contains 6.3 grams of protein.
