Mosquito borne diseases are prevalent in more than 100 countries, infecting 300-500 million people and causing about one million deaths every year. In India, more than 40 million people suffer from mosquito transmitted diseases. Malaria, Chikungunya and Dengue are the most prevalent diseases spread by mosquitoes.

Malaria is transmitted by the female Anopheles mosquito that bites mainly at night especially between mid night and early morning. The patient can suffer from high fever and chills, severe headache and muscle aches with occasional vomiting and diarrhea.

Dengue is transmitted by Aedes Aegypti mosquito, which bites mainly during the day. It occurs in two forms: Dengue Fever and Dengue Hemorrhagic Fever (DHF). Dengue Fever is a severe, flu-like illness, which rarely causes death. Dengue Hemorrhagic Fever (DHF) is a more severe form of disease which may cause death. Its main symptoms are sudden high fever, severe headache, muscle and joint pains.

Chikungunya fever is an illness that is spread by the bite of infected mosquitoes. The disease resembles dengue fever, and is characterized by severe, sometimes persistent, joint pain, fever and rash. No vaccine is available against this virus infection.

Prevention of mosquito transmitted diseases is entirely dependent upon taking steps to avoid mosquito bites and elimination of mosquito breeding sites.

Do's

- Cover water holding containers & do not let water stagnate in coolers or air-conditioning units
- Clean the house gutters to prevent stagnation of rainwater
- Use mosquito repellents to prevent the entry of mosquitoes into your home

Don'ts

- Leave water storage containers uncovered
- Let water stagnate in the water cooler unit
- Leave flower vases dirty
- Place any tray or water collectors beneath and/or on top of any air-conditioning unit
