

PUTTING LENSES UNDER THE LENS.

Choosing the right pair of lenses is never easy, given the wide range of brands and features you are faced with. However with a little bit of foreknowledge on the types available today and their features, choosing the right lenses can actually be fun.

New Age Materials

The latest advances in technology have led to spectacle lenses becoming stronger, lighter and tougher than ever before. Lenses in materials like new age materials like polycarbonate & Trivex are not only shatter resistant & up to 10-25% lighter than your average plastic lenses, they also offer 100% UV protection.

Titan Lites and Titan Pinnacle encompasses the characteristics of lighter, tougher and 100% UV protection lenses.

Anti-Reflective Coating

Reflections are a problem for spectacle users. An anti-reflective coat on the lenses can reduce unwanted reflections. As a result you'll see less of glare, annoying reflections, and halos around lights. All of which are of significant benefit when working in front of a computer or while driving at night.

Titan Clarion is an anti-reflection coating that provides better clarity of vision, enhances cosmetic appearance, reduces eye fatigue & is easy to clean.

Apart from the wide range of Titan lenses-all of which come with a 6 month warranty-Essilor, Kodak & Nikon lenses are also available at Titan Eye+ stores

To get a first-hand experience of just what the right lenses can do for you, walk into your nearest Titan Eye+ showroom.

Electro-Magnetic Interference (EMI) Rays Protective Coating

While using a computer or watching television, you are exposed to harmful electromagnetic rays which affect the eyes over time.

Titan Clarion Shield helps protect your eyes from electromagnetic interference which originates from electronic equipments and screens.

Dust and Scratch Resistance Coating

Lenses treated with scratch resistant coatings keep them from getting scratched during normal handling. The coating makes the lenses last longer by keeping them clear and visibly new. Lenses can also be treated with dust resistant coatings which help keep them clear even without constant cleaning or rubbing with cloth cleaners.

Titan Armor comes with a scratch resistant coating providing a longer life to your lenses.

UV Protection Coating

Lenses treated with UV protection coating can protect the eyes from harmful ultraviolet light that can cause serious damage to the eyes in the long run. An ultraviolet treatment is simple and quick to apply to most plastic eye glass lenses and it does not change the appearance of the lenses.

Photo chromatic lenses

Transitional lenses, also known as photo chromatic lenses, become dark only when they are exposed to sun light. The advantage of opting for photo chromatic lenses is that they can be used both indoors and outdoors.
