temperature by actively either adding or removing heat, regardless of the environment.

Vistakula has tied up with Tata Advanced Materials for co-branding and is targeting the defence sector as well as industrial houses. He is also working on a system to cool cows to increase their milk production and is in talks with Amul in Gujarat. He says, "It is a medically proven fact that the yield of cows goes up in winter. We are now trying to recreate that year-round."

A first-generation entrepreneur from Hyderabad—his father retired as chief engineer from the Central Power Distribution Company of Andhra Pradesh while his mother is

an artist—Vistakula was fascinated by experiments while growing up. At the age of 10, he converted household items like spoons and forks into electromagnets much to his mother's chagrin and at 12, he developed a welding flame tool. He was deeply influenced by Nobel Prize-winners and always wanted to bag his own, he says. Now with his own company, he says his biggest challenges are educating the customer and finding the right partners. "But nothing is insurmountable," he says. Dhama has a turnover of Rs 27 lakh and aims to make 50-100 jackets a month soon, all assembled at the workshop in the MID campus, in order to keep costs

low. "I want to make Dhama a \$100-million company in the next five years," says Vistakula.

Although there are other companies like Foster Miller, MS Cooling, Aspen Systems and Med-Eng Systems which make climate controlled apparel, Vistakula claims that most can't do both heating and cooling. Moreover, he says, they usually weigh 5 kg, excluding the load of the battery. "We are reducing that for better performance," he says.

At the recent Defence Expo in Delhi, the global head of Dupont told him that his jacket was the most innovative thing he had ever seen. That for Vistakula was the coolest thing ever. ■
